Shop Simulation

On-line resource instructions.

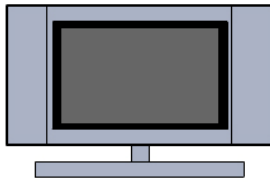

This teaching resource for your Interactive Whiteboard is useful for starters or plenaries where you would like to practice basic money addition with your students. A list of items appears on a receipt. When you feel ready the students are asked to total their prices.

Depending on the size of your room the values may be a little small to see from a distance so it is useful to read them out as they appear. It works well using mini-whiteboards with a competitive element added to it. Students hold their answer up as soon as they have calculated it. The winner is the one who gets it correct first.

Buttons

Shops: Choose the type of shop at the top. The one selected will have its type appear in red beneath it. This allows some differentiation. Supermarkets have lower priced items than electrical stores. You can only change shops before a sale has begun.
